## About

Full stack developer with 7 years of experience in software, web applications and distributed systems. I work on solutions that combine backend and frontend development, embedded systems, network protocols and data processing. I have helped build and ship solutions across several fields, including satellite communications, network management, logistics and emergency response platforms.

## Experience

**Comtech Telecommunications** · Full stack developer · Montréal, QC

Jun 2022 – present

- Built software for satellite communication and network management systems, integrating embedded systems, network protocols and modern web interfaces.
- Built network management and monitoring tools in Vue.js to interact with equipment and visualize data in real time.
- Built data visualization interfaces and vector maps optimized for low-bandwidth environments.
- Automated software testing and deployment on Linux with Git, Jenkins and Docker.

**wherEX** · Full stack developer · Chile

Sep 2020 – Feb 2022

- Led the full migration of a PHP/Angular platform to a microservices architecture with Go and React.
- Designed and built backend services and web interfaces to process and visualize data at scale.
- Implemented a ranking algorithm using user profiles and market data to improve recommendations.
- Built scalable solutions together with engineering and product teams.

**Falabella Retail** · Full stack developer · Chile

Feb 2018 – Jun 2018

- Designed and built, end to end, a last-mile logistics system for a major retailer, with Go and React.
- Automated key logistics processes, cutting operating costs and optimizing delivery team size by more than 80%.
- Designed and deployed an automated geocoding system processing thousands of addresses a day.
- Optimized delivery routes together with several teams to better meet operational needs.
- Built a predictive system that accurately estimates delivery time windows.

**CITIAPS** · Front-end developer · Santiago, Chile

Mar 2017 – Jan 2018

- Built a government-backed emergency response platform in Vue.js, with real-time volunteer tracking and mobile notifications.
- Built a Java and AI-based emotion analysis system processing data from multiple cameras.
- Created interactive data visualizations with Vue.js and D3.js for geolocated data analysis.
- Built an interactive route-tracking system for a papal visit with Vue.js and the Google Maps API.

**Universidad de Santiago de Chile** · Lecturer

Mar 2020 – Mar 2022

- Theoretical and practical foundations of logical thinking and algorithms for engineering students: programming fundamentals, distributed systems.

## Technical skills

|                  |                                                                                          |
|------------------|------------------------------------------------------------------------------------------|
| <b>Backend</b>   | Go, Python, C, PHP, Django                                                               |
| <b>Frontend</b>  | React, Vue.js, Angular, D3.js                                                            |
| <b>Systems</b>   | Linux, embedded systems, multithreaded programming, memory management, network protocols |
| <b>Data</b>      | MySQL, MongoDB, real-time processing                                                     |
| <b>DevOps</b>    | Docker, AWS, Nginx, Git, Jenkins                                                         |
| <b>Languages</b> | Spanish, English, French                                                                 |

## Projects

- Orbit Tracker** – daemon, API and real-time dashboard for a tracking mount. [github](#)
- Route Optimizer** – Go API, shortest route with goroutines. [github](#)
- Hantavirus Tracker** – live map of geolocated cases. [github](#)
